Reasons For Allowance

The prior art does not disclose or fairly suggest a light treatment apparatus comprising an optical module for generating an array of light beams with a sub-scan module for dithering the beams in a sub-scan direction that is transverse to a main scan direction and the dithering travel is less than the sub-scan direction length of the array and further comprising a sensor for detecting the main scan travel to provide positive control of the dithering process. The dithering of spot patterns is known in ink jet printers as taught by U.S. Patent 6,805,428 to Otsuki to yield higher quality images. Movable arrays are known for surface inspections as taught by U.S. Patent Application Publication US 2005/0018199 to Leblanc for the inspection of LCD panels. However, neither of these teachings is analogous to the art of the application and there is no clear motivation for combination.

Conclusion
